An activity coefficient is a factor used in thermodynamics to account for deviations from ideal behaviour in a mixture of chemical substances. In an ideal mixture, the microscopic interactions between each pair of chemical species are the same (or macroscopically equivalent, the enthalpy change of solution and volume variation in mixing is zero) and, as a result, properties of the mixtures can ...

One possible answer is to claim that we possess a great store of “instinctive knowledge” picked up from experience. This is the solution that Ernst Mach offered (see Mach, 1897 and 1905; for most instructive assessments of his views see Kühne 2006, pp. 165–202, and Sorensen 1992, pp. 51–75). We will get back to his solution further down.
