The Springer Series in Synergetics was founded by Herman Haken in 1977. Since then, the series has evolved into a substantial reference library for the quantitative, theoretical and methodological foundations of the science of complex systems. Through many enduring classic texts, such as Haken's Synergetics and Information and Self-Organization, Gardiner's Handbook of Stochastic Methods, Risken's The Fokker Planck-Equation or Haake's Quantum Signatures of Chaos, the series has made, and ...

Part of the Springer Series in Synergetics book series (SSSYN) Abstract This chapter will focus on the numerical investigation of nonlinear dynamics of localized excitations (acoustic and topological solitons and breathers) in polymer macromolecules.

Solitons in Polymer Systems | SpringerLink

In general, it is not possible to isolate a molecular chain in physical systems. It is surrounded by other chains, which form its substrate. To consider the chain interaction with its environment, an additional potential $W(x)$ is introduced into the model, describing the interaction of a chain site with its substrate (see Fig. 3.1).

Synergetics may be considered as an interdisciplinary effort dealing with the general problem of how science can cope with complex systems. The preceding symposia on synergetics were devoted to systems of physics, chemistry and partly also biology and sociology.
